Instead of using expensive alloys to construct a tank or processing vessel, it is often more economical to use a less expensive metal, such as carbon steel, and install a lining to provide protection from corrosion. Corrosion of Linings and Coatings: Cathodic and Inhibitor Protection and Corrosion Monitoring offers focused coverage for professionals interested in protective linings and coatings, corrosion protection, and monitoring techniques. The author details various materials and methods for controlling and protecting against corrosion. He discusses the use of mortars, grouts, and monolithic surfaces and explains how the use of inhibitors and cathodic protection help prevent corrosion. The book also provides details for various types of linings materials and coatings and includes valuable compatibility charts for each material covered. The author concludes with an explanation of a variety of corrosion monitoring techniques currently available.

Details the proper methods to assess, prevent, and reduce corrosion in the oil industry using today's most advanced technologies This book discusses upstream operations, with an emphasis on production, and pipelines, which are closely tied to upstream operations. It also examines protective coatings, alloy selection, chemical treatments, and cathodic protection—the main means of corrosion control. The strength and hardness levels of metals is also discussed, as this affects the resistance of metals to hydrogen embrittlement, a major concern for high-strength steels and some other alloys. Offers information on all types of corrosion, corrosion theory and the major materials of construction used for reducing corrosion, including metals, plastics, linings, coatings, elastomers and masonry products. The text provides analyses of corrosion testing techniques, materials handling and fabrication procedures, on-stream and off-stream corrosion monitoring, design methods that prevent or control corrosion, and more.

Cathodic protection is a method to reduce corrosion by minimizing the difference in potential between anode and cathode. This is achieved by applying a current to the structure to be protected (such as a pipeline) from some outside source. When enough current is applied, the whole structure will be at one potential; thus, anode and cathode sites will not exist. Cathodic protection is commonly used on many types of structures, such as pipelines, underground storage tanks, locks, and ship hulls.

A variable game changer for those companies operating in hostile, corrosive marine environments, Corrosion Control for Offshore Structures provides critical corrosion control tips and techniques that will prolong structural life while saving millions in cost. In this book, Ramesh Singh explains the ABCs of prolonging structural life of platforms and pipelines while reducing cost and decreasing

the risk of failure. Corrosion Control for Offshore Structures places major emphasis on the popular use of cathodic protection (CP) combined with high efficiency coating to prevent subsea corrosion. This reference begins with the fundamental science of corrosion and structures and then moves on to cover more advanced topics such as cathodic protection, coating as corrosion prevention using mill applied coatings, field applications, and the advantages and limitations of some common coating systems. In addition, the author provides expert insight on a number of NACE and DNV standards and recommended practices as well as ISO and Standard and Test Methods. Packed with tables, charts and case studies, Corrosion Control for Offshore Structures is a valuable guide to offshore corrosion control both in terms of its theory and application.
