This report is a comprehensive greenhouse gas inventory for both New York City as a whole & for City gov't. operations. While there is no substitute for fed. action, all levels of gov't. have a role to play in confronting climate change & its potential impacts, & this report will help N.Y. begin doing that more aggressively. Mayor Bloomberg created the Mayor's Office of Long-term Planning & Sustainability & charged it with developing a comprehensive sustainability plan for the City's future. The result is PlaNYC, which has set a goal of reducing missions by 30% below 2005 levels by 2030, an ambitious but achievable goal. This greenhouse gas inventory is a critical first step in reducing N.Y.'s contribution to global carbon dioxide levels. Illustrations.

How the success and popularity of recycling has diverted attention from the steep environmental costs of manufacturing the goods we consume and discard. Recycling is widely celebrated as an environmental success story. The accomplishments of the recycling movement can be seen in municipal practice, a thriving private recycling industry, and widespread public support and participation. In the United States, more people recycle than vote. But, as Samantha MacBride points out in this book, the goals of recycling—saving the earth (and trees), conserving resources, and greening the economy—are still far from being realized. The vast majority of solid wastes are still burned or buried. MacBride argues that, since the emergence of the recycling movement in 1970, manufacturers of products that end up in waste have successfully prevented the implementation of more onerous, yet far more effective, forms of sustainable waste policy. Recycling as we know it today generates the illusion of progress while allowing industry to maintain the status quo and place responsibility on consumers and local government. MacBride offers a series of case studies in recycling that pose provocative questions about whether the current ways we deal with waste are really the best ways to bring about real sustainability and environmental justice. She does not aim to debunk or discourage recycling but to help us think beyond recycling as it is today.

"Meticulous . . . [Nagle's] passion for the subject really comes to life." --The New York Times New York City produces more than twelve thousand tons of household trash and recyclables a day. As quickly as it accumulates, it's hauled away. But who makes that happen? What's life like for the workers with careers built around garbage? In *Picking Up*, the anthropologist Robin Nagle takes us inside New York City's Department of Sanitation, a largely unseen and often unloved army responsible for keeping the city alive. Nagle spent a decade with sanitation people of all ranks to learn what it takes to manage Gotham's garbage. She even took the job herself, driving trucks and plowing snow while enduring the physical aches, public abuse, and risk of injury that are constant realities of the job. Nagle offers an insider's perspective on the complex hierarchies, intricate rules, and obscure language unique to this mostly invisible world. Not just a contemporary account, *Picking Up* charts New York City's four-hundred-year struggle with trash. It traces the city's waste-management efforts from a time when filth overwhelmed the streets to today's far more vigorous practices, which have made the city cleaner than it's been in decades. Complete with vividly evoked characters and memorable descriptions of the sights and smells of the job, *Picking Up* reveals the vital role sanitation workers play in every city across the globe.

America's largest city generates garbage in torrents—11,000 tons from households each day on average. But New Yorkers don't give it much attention. They leave their trash on the curb or drop it in a litter basket, and promptly forget about it. And why not? On a schedule so regular you could almost set your watch by it, someone always comes to take it away. But who, exactly, is that someone? And why is he—or she—so unknown? In *Picking Up*, the anthropologist Robin Nagle introduces us to the men and women of New York City's Department of Sanitation and makes clear why this small army of uniformed workers is the most important labor force on the streets. Seeking to understand every aspect of the Department's mission, Nagle accompanied crews on their routes, questioned supervisors and commissioners, and listened to story after story about blizzards, hazardous wastes, and the insults of everyday New Yorkers. But the more time she spent with the DSNY, the more Nagle realized that observing wasn't quite enough—so she joined the force herself. Driving the hulking trucks, she obtained an insider's perspective on the complex kinships, arcane rules, and obscure lingo unique to the realm of sanitation workers. Nagle chronicles New York City's four-hundred-year struggle with trash, and traces the city's waste-management efforts from a time when filth overwhelmed the streets to the far more rigorous practices of today, when the Big Apple is as clean as it's ever been. Throughout, Nagle reveals the many unexpected ways in which sanitation workers stand between our seemingly well-ordered lives and the sea of refuse that would otherwise overwhelm us. In the process, she changes the way we understand cities—and ourselves within them.

An argument that social, political, and economic systems maintain power by discarding certain people, places, and things. Discard studies is an emerging field that looks at waste and wasting broadly construed. Rather than focusing on waste and trash as the primary objects of study, discard studies looks at wider systems of waste and wasting to explore how some materials, practices, regions, and people are valued or devalued, becoming dominant or disposable. In this book, Max Liboiron and Josh Lepawsky argue that social, political, and economic systems maintain power by discarding certain people, places, and things. They show how the theories and methods of discard studies can be applied in a variety of cases, many of which do not involve waste, trash, or pollution. Liboiron and Lepawsky consider the partiality of knowledge and offer a theory of scale, exploring the myth that most waste is municipal solid waste produced by consumers; discuss peripheries, centers, and power, using content moderation as an example of how dominant systems find ways to discard; and use theories of difference to show that universalism, stereotypes, and inclusion all have politics of discard and even purification—as exemplified in “inclusive” efforts to broaden the Black Lives Matter movement. Finally, they develop a theory of change by considering “wasting well,” outlining techniques, methods, and propositions for a justice-oriented discard studies that keeps power in view.

Traces the development of the sanitary and health problems of New York City from earliest Dutch times to the culmination of a nineteenth-century reform movement that produced the Metropolitan Health Act of 1866, the forerunner of the present New York City Department of Health. Professor Duffy shows the city's transition from a clean and healthy colonial settlement to an epidemic-ridden community in the eighteenth century, as the city outgrew its health and sanitation facilities. He describes the slow growth of a demand for adequate health laws in the mid-nineteenth century, leading to the establishment of the first permanent health agency in 1866.

This book focuses on waste management which is the collection, transport, processing, recycling or disposal of waste materials. The term usually relates to materials produced by human activity, and is generally undertaken to reduce their effect on health, aesthetics or amenity. Waste management is also carried out to reduce the materials' effect on the environment and to recover resources from them. Waste management can involve solid, liquid or gaseous substances, with different methods and fields of expertise for each. Waste management practices differ for developed and developing nations, for urban and rural areas, and for residential and industrial, producers. Management for non-hazardous residential and institutional waste in metropolitan areas is usually the responsibility of local government authorities, while management for non-hazardous commercial and industrial waste is usually the responsibility of the generator.

There have always been homeless people in the United States, but their plight has only recently stirred widespread public reaction and concern. Part of this new recognition stems from the problem's prevalence: the number of homeless individuals, while hard to pin down exactly, is rising. In light of this, Congress asked the Institute of Medicine to find out whether existing health care programs were

ignoring the homeless or delivering care to them inefficiently. This book is the report prepared by a committee of experts who examined these problems through visits to city slums and impoverished rural areas, and through an analysis of papers written by leading scholars in the field.

Almost 70% of parents who refuse to vaccinate their children do so because they believe vaccines may cause harm. Indeed vaccines have been blamed for causing asthma, autism, diabetes, and many other conditions most of which have causes that are incompletely understood. *Do Vaccines Cause That?! A Guide for Evaluating Vaccine Safety Concerns* provides parents with clearly understandable, science-based information about vaccines, immunization, and vaccine safety.

Examines the culture, politics, and history of the movement for environmental justice in New York City, tracking activism in four neighborhoods on issues of public health, garbage, and energy systems in the context of privatization, deregulation, and globalization. Racial minority and low-income communities often suffer disproportionate effects of urban environmental problems. Environmental justice advocates argue that these communities are on the front lines of environmental and health risks. In *Noxious New York*, Julie Sze analyzes the culture, politics, and history of environmental justice activism in New York City within the larger context of privatization, deregulation, and globalization. She tracks urban planning and environmental health activism in four gritty New York neighborhoods: Brooklyn's Sunset Park and Williamsburg sections, West Harlem, and the South Bronx. In these communities, activism flourished in the 1980s and 1990s in response to economic decay and a concentration of noxious incinerators, solid waste transfer stations, and power plants. Sze describes the emergence of local campaigns organized around issues of asthma, garbage, and energy systems, and how, in each neighborhood, activists framed their arguments in the vocabulary of environmental justice. Sze shows that the linkage of planning and public health in New York City goes back to the nineteenth century's sanitation movement, and she looks at the city's history of garbage, sewage, and sludge management. She analyzes the influence of race, family, and gender politics on asthma activism and examines community activists' responses to garbage privatization and energy deregulation. Finally, she looks at how activist groups have begun to shift from fighting particular siting and land use decisions to engaging in a larger process of community planning and community-based research projects. Drawing extensively on fieldwork and interviews with community members and activists, Sze illuminates the complex mix of local and global issues that fuels environmental justice activism.
